RE: Response to EPA Letter Dated August 7, 2006
Sherwin-Williams Gibbsboro Sites, Route 561 Dump Site

Dear Mr. Klimcsak:

The Sherwin-Williams Company (Sherwin-Williams) has received your August 7, 2006 letter referenced above and is providing a response. Overall, we are in agreement with EPA's comments and suggestions, as we discussed at the September 6, 2006 meeting.

We are providing a point-by-point response in order to ease your review and have included the text from EPA's letter, which is depicted in *italics*. Sherwin-Williams' response immediately follows each EPA comment in **Bold**. Likewise, Sherwin-Williams has utilized the same format for its response to the attached NJDEP comments. Many of these comments were discussed at the September 6, 2006 meeting held between USEPA, NJDEP and Sherwin-Williams.

The Environmental Protection Agency (EPA) has completed its review of the May 23, 2006, Evaluation of Strategic Sampling Results, Route 561 Dump Site submitted by the Sherwin-Williams Company (SWC) and offers the following comments. In addition, the New Jersey Department of Environmental Protection Agency (NJDEP) has provided comments on the May 23, 2006 document as well, these comments are attached (Attachment).

Comment Summary

EPA approves the proposed changes to the list of Contaminants of Potential Concern (COPCs) for soil sample collection presented in the May 23, 2006, Evaluation of Strategic Sampling Results, Route 561 Dump Site. This evaluation was based on EPA's review of

the 2005 RI soil data, and the soil and sediment summary data collected during NJDEP's 1994 soil/sediment sampling efforts and EPA Region 2's 1995 soil/sediment sampling efforts.

Sherwin-Williams acknowledges the above-referenced comment and will implement the proposed changes to the list of Contaminants of Potential Concern (COPCs) during the Phase II Investigation.

Based on the review of the data cited above; including the 2005 RI groundwater, sediment, and surface water data - as well as, the proposed 2006 residential sampling program, EPA's comments will address the following items separately: General; Groundwater; Residential; Sediment; Soil; and Surface Water.

General Comments

1. *Future inclusion of results from previous investigations (whether from those performed by the SWC, NJDEP, USEPA, etc.) should include the following additional information: citations as to what reports and sampling events (titles and dates) are being referenced; the depths of the samples collected; the analytical methods utilized; and the detection limits attained.*

In the event that historic data are presented in future submittals to the USEPA, the information requested will be provided.

In addition, clarification as to what data was being included from previous investigations in the May 23, 2006 Dump Site plan is requested. Information, previously requested by EPA on 7/06/06, was provided by Weston (SWC's RI contractor) on July 10, 2006 via an e-mail; however, this information still does not match the information which is included in the 2003 RI/FS Work Plan (Figures 3-9 and 3-10). For example, it is stated within the legend that EPA collected soil samples with the use of the XRF/with CLP splits. It is unclear whether all samples were sent for CLP analyses or just a portion were? In addition, whereas Figure 3-9 presents the data as being collected by EPA, Figure 3-10 states that it was collected by the SWC. These additional questions were brought to the attention of Weston on July 19, 2006.

As discussed with the USEPA during the September 6, 2006 meeting, Sherwin-Williams has reviewed the historic information submitted in the May 23, 2006 letter on figures 6 and 7 and has concluded that the majority of the results were obtained by the USEPA by XRF analysis. Split samples were collected for only a small portion of the total.

To clarify the sampling history, Sherwin-Williams is including with this response:

- **Figure 6 which presents the results of all lead and arsenic soil and sediment samples collected at the Dump Site and analyzed by CLP methods; and**
- **Tables 1 and 2 (soil and sediment results, respectively) which summarize the date, entity conducting the sampling and the analytical methods employed for each soil and sediment sample collected at the Dump Site.**

As a note, please be advised that Figures 6 and 7 from the original submission *Evaluation of Strategic Sampling Results, Route 561 Dump Site* dated May 23, 2006, have been replaced by one figure (Figure 6) depicting the Dump Site soil and sediment exceedances (arsenic and lead only) analyzed using laboratory methodology only. XRF screening results are not included on this figure. In any future submissions, data collected with field tools, such as XRF, will be presented separately from the results of CLP analyses.

2. *The reason that % moisture and/or, pH were not analyzed/presented for several soil samples collected from the Dump site (ex. DMSB0001- 0008 and others) should be provided.*

As we discussed in our meeting on September 6, 2006, CLP methodology requires that the laboratories report % solids for every sample analyzed. The EPA-approved work plan required the collection of a soil sample for full TCL/TAL analysis from the 0 to 2 foot depth interval. However, NJDEP requires that VOC samples collected within the upper 2 feet of the subsurface must be collected from the 1.5 - 2 foot depth interval only. Since the VOC sample could have different % solids values than the other fractions due to their varying depths of collection, Sherwin-Williams requested that the laboratory measure % solids for the VOC fraction separate from the remaining fractions. Due to some data management constraints, Sherwin-Williams requested that the laboratories report % moisture (the inverse of % solids) for the VOC fraction and % solids for the remaining fractions. Unfortunately, this issue was not recognized until half way through the Strategic Sampling activities. Accordingly, the laboratories were not electronically reporting % solids and % moisture consistently until later in the 2005 sampling efforts. Fortunately, all of the necessary information was being correctly reported in the hard copy data packages. In our efforts to provide data for the Dump Site in an expedient manner we had not had time to go back and manually enter the missing data into our database. Therefore, when data tables were generated the missing information appeared as "NA" on the tables. Weston is currently manually entering the missing information into the database such that these data gaps will not be present in future reports.

The missing pH results are associated with a separate issue. Laboratory measured pH was not a required analysis in the EPA-approved work plan and was not requested by Sherwin-Williams for analysis. However, the CLP methods require that each laboratory measure pH and provide that information as part of the QA/QC information. STL-Buffalo mistakenly reported pH as an analysis rather than as just QA/QC information in their electronic data submittal. When we processed their electronic data submittals the pH measurements were loaded as an analysis. However, since Buffalo was the only lab reporting pH measurements in error we did not receive pH data for all the samples analyzed. When the data tables were generated, only those samples analyzed by Buffalo had pH results reported in the data tables. All other pH results were reported as "NA" since no results existed in the database. Fortunately, all of the necessary information was being correctly reported as QA/QC information in the hard copy data packages. Weston is also currently manually entering the missing information into the database such that these data gaps will not be present in future reports.

3. *The rationale for why the two tributaries (previously depicted on all maps approved by EPA) are no longer depicted on the Dump site figures, should be provided. If the results of the Wetlands delineation have shown that areas are now Wetlands, these changes should be reflected in updated figures as a separate submittal for review and then incorporated in updated figures.*

As discussed at the September 6, 2006 meeting, the difference between the earlier and current depictions of the stream tributaries on the Dump Site figures is due to the incorporation of a more recent aerial photograph from which the current Dump Site base map (used for all Dump Site figures) has been developed.

To resolve the differences between the previous and current figures, Sherwin-Williams performed a stream alignment survey in order to determine the actual path of the defined stream channel(s) in this area. GPS data points were collected and the defined stream channel(s) have been incorporated into the base map for this site.

4. *It is stated on Page 4, that surface water data support's the conclusion that the high concentrations of COPCs found in surface water samples from the center of the Rt. 561 Dump site are not currently being transported to White Sands Branch or other down stream locations. Although this statement may be true for the current data, a complete fate and transport analysis has not been conducted to establish transport mechanisms and of course this is not true for suspended solids. This is evident by the fact that soil and sediment samples collected both within and adjacent to White Sands Branch downstream (below the center of the site) and within the Vacant Lot exceed both soil and sediment screening criteria.*

It is acknowledged that a complete fate and transport analysis of all historic and current transport mechanisms has not been conducted, and Sherwin-Williams does not disagree with the comment that the presence of COPCs in down stream portions of White Sands Branch may support a conclusion that transport of COPCs via surface water has occurred in the past. However, the statement on Page 4 of the May 23, 2006 is factual; the concentrations of COPCs found at location WSDW 0011 (the center of the Dump Site) are several orders of magnitude greater than those found at location WSDW 0009, at the location White Sands Branch leaves the site. We will defer other conclusions on this matter until a complete fate and transport analysis has been performed.

5. *It is stated on Page 6, that horizontal soil delineation within the Wa-Wa parking lot will be consistent with the scope of work approved in the November 2003 Work Plan. However, the proposed soil sample locations depicted within Figure 8 of the May 23, 2006 plan do not match those presented in Figure 5-2 of the approved Work Plan.*

It was not the intent of the May 23, 2006 submittal to imply that the entire proposal for horizontal delineation in the Wawa parking lot was consistent with the approved Work Plan. Rather, it was intended, as discussed in the second paragraph of the "Wawa Property" section (May 23, 2006 Dump Site submission), to state that the initial boring locations and sample collection depths would be consistent with the protocol in the Work Plan. Based upon the results of these initial samples, a determination will then be made as to whether additional samples (as depicted in Figure 5-2 of the approved November 2003 Work Plan) are warranted.

Groundwater Investigation

Although EPA agrees that additional shallow and deep monitoring wells should be installed at the Rt. 561 Dump site and off-site on the western side of the Rt. 561 Dump site, near the Vacant Lot, it is difficult at this time to evaluate and comment on the proposed characterization approach. In addition to not providing data/figures that identify the local and/or regional groundwater flow direction, the submitted information did not include groundwater monitoring well logs/construction specifications (e.g., screened zone, well specifications, etc.), a geologic/hydrogeologic cross-section evaluation, and/or tables that provide water level elevations, depth to water, top of casing, etc.

Further, without this information/data, how did SWC determine upgradient, sidegradient, and downgradient groundwater flow conditions, and how can a thorough discussion regarding underlying geologic/hydrogeologic conditions, possible conceptual site models, contaminant transport, and other groundwater characteristics be considered?

As discussed at the September 6, 2006 meeting, Sherwin-Williams will provide to the USEPA a separate summary of ground water results for all sites, including water level and flow information. Sherwin-Williams is, however, submitting the requested information for the Dump Site in this response to comments. Presented in Appendix A is a summary of the field methodology used to install and sample the monitoring wells, and the results of water level measurements and hydraulic testing performed on the wells. Based on the information collected at the site and presented in Appendix A, Sherwin-Williams has concluded that the well locations originally proposed are appropriate for the next phase of the ground water investigation, and is requesting EPA concurrence with these locations.

Residential Sampling

It is recognized that the residential soil sampling locations presented in Figure 8 are conceptual. We agree that final locations will be selected in the field during a site visit by either EPA or by members of TetraTech, Inc. (EPA's contractor) along with members of SWC or Weston; and that final sampling locations will be selected based on site conditions (present on or near the resident's property) and through the assessment of existing data. EPA provides the following comments.

1. *EPA requires that the soil samples collected as part of the residential sampling program be consistent with that used at the residential homes along Hilliard's Creek and that they therefore be analyzed for full TAL/TCL analysis.*

All residential samples will be analyzed for full TAL/TCL analysis.

2. *SWC is proposing to collect six borings around the residential property located to the southwest (as opposed to the 17 proposed in the 2003 Work Plan); however, EPA is requiring that 9 samples be collected (as similar to that proposed by SWC for the residence to the northeast) at this property as well.*

Sherwin-Williams will install 5 additional residential borings at the residential property located to the southwest for a total of 9 residential boring locations. The samples will be analyzed for full TAL/TCL analysis. Revised Figure 8 presents the proposed residential sample locations.

3. *Two residential soil samples, for the property to the southwest, are incorrectly identified as non-residential soil samples in Figure 8.*

As depicted in Figure 5-2 of the approved November 2003 Work Plan, and clarified during the September 6, 2006 meeting, the 2 sample locations noted by the USEPA (green triangles) were not intended to be considered residential borings that would be sampled for full TAL/TCL parameters (the residential boring locations are depicted as purple triangles).

As discussed in the above-referenced Residential Sampling Comment #2, the proposed residential sample locations are highlighted on revised Figure 8. The residential samples will be analyzed for full TAL/TCL analysis.

Sediment Sampling

Vertical delineation of sediment contamination within White Sands Branch, specifically in transects WST-12 and WST-13, was not determined. Therefore, it is required that further vertical delineation samples be proposed by the SWC for collection in 2006.

Sherwin-Williams agrees that additional samples are necessary to complete vertical delineation in the sediment at transects WST-12 and WST-13 as the samples collected from the 1.5' – 2.0' intervals in each location contained COPCs at levels above screening criteria. Also, Sherwin-Williams notes that the deepest sample taken from the culvert location (WSDD0025) also contained lead and arsenic at levels greater than the screening criteria. Therefore, additional samples will be collected for vertical delineation at three sediment sampling locations:

- Culvert – WSDD0025
- WST-12 – WSDD0001
- WST-13 – WSDD0004

The proposed sample locations are presented on revised Figure 8. Presented in the response to Soil Sampling Comment #6 is a sampling protocol Sherwin-Williams is proposing to use for all new soil and sediment sampling. Since sampling has already been performed in the locations to which Sherwin-Williams is returning to perform vertical delineation, a slight modification of the general protocol will be used.

Samples will be collected every two feet beginning at the 2.5' – 3.0' interval. The samples will be field screened with the XRF unit and sample collection will be terminated at the interval where the XRF analyses find no COPCs above screening criteria. Samples from the following intervals will be sent to the analytical laboratory for TAL metals analysis:

- The initial 2.5' – 3.0' interval;
- The interval at which the XRF analysis finds no COPCs at concentrations greater than screening criteria; and, assuming more than two intervals are found by XRF analysis to contain COPCs at concentrations greater than screening criteria,

- The interval between the initial 2.5' – 3.0' interval and the bottom interval (as defined in the previous bullet) that contains the highest concentration of COPCs.

Soil Sampling

Further vertical delineation sampling at 2005 RI soil sample locations

1. EPA requires that the following 2005 RI soil sample locations (both from the strategic soil sampling locations and those soil samples from White Sands Branch transects) be further delineated based on the review of existing data and site conditions: DMSB-0001, DMSB-0007, DMSB-0010, DMSB-0023, DMSB-0029, DMSB-0033, DMSB-0036 (which was only sampled to 2 ft.) and DMSB-0038.

Sherwin-Williams will collect additional vertical delineation samples at the above-referenced soil locations. The proposed sample locations are highlighted on revised Figure 8.

As discussed above for the additional vertical delineation of sediment, samples have already been obtained from various depth intervals ranging from 1.0' – 1.5' to 9.5' – 10.0' at the referenced locations. Therefore, the protocol discussed in response to Comment #6, below, is not completely applicable to these sampling locations. The sampling will be conducted as per the following methodology:

- Samples will be collected from the initial sampling interval presented in the table below and from the six-inch interval at the bottom each two-foot interval thereafter. For example, at location DMSB0001, the initial sample, as presented below, will be collected from the 1.5' – 2.0' interval, and the next sample will be collected at 3.5' – 4.0', the bottom six-inches of the 2.0' – 4.0' interval.
- All samples will be field screened with the XRF unit. Sample collection will continue until the XRF analysis finds no COPCs at levels greater than screening criteria (the vertical delineation sample). A confirmatory sample will be collected from the bottom six-inches of the first two-foot interval at which the XRF analysis found no COPCs at concentrations greater than screening criteria.
- One additional sample will be collected from the next two-foot interval to verify that the vertical extent of elevated constituents has been defined. If this sample is found through XRF analysis not to contain COPCs at concentrations greater than screening criteria, no additional sampling will be performed. If one or more COPCs are found at

concentrations greater than screening criteria, additional samples will be collected at two-foot intervals until no COPCs are found at concentrations greater than the screening criteria.

The following samples will be sent to the analytical laboratory for analysis for TAL metals.

- **The initial sample,**
- **The sample interval that contains the highest COPC concentration as determine by XRF, and**
- **The first vertical delineation sample at which no COPCs are found at concentrations greater than screening criteria.**

This approach identifies the concentration of COPCs at the first interval of interest, the highest concentration of COPCs in the subsurface, and the depth at which COPCs are vertically delineated at each sample location.

Initial Sampling Intervals for Dump Site Vertical Delineation

Sample Location	Deepest Sampling interval, Strategic Sampling	Initial Sampling Interval, Vertical Delineation
1	0' – 0.5'	1.5' – 2.0'
7	1.0' – 1.5'	2.5' – 3.0'
10	1.0' – 1.5'	2.5' – 3.0'
23	1.0' – 1.5'	2.5' – 3.0'
29	9.5' – 10.0'	11.5' – 12.0'
33	1.0' – 1.5'	2.5' – 3.0'
36	0' – 2'	2.5' – 3.0'
39	1.0' – 1.5'	2.5' – 3.0'

Proposed (new) soil boring locations

1. SWC has proposed one "new" additional soil boring within the Rt. 561 Dump site, EPA does not concur with it's proposed location. 2005 data is available from sample locations DMSB-0029 and DMSB-0043, the proposed (new) location is in between these two locations and may not offer any new insight to site conditions. EPA requires that two (new) soil boring locations be installed in the immediate vicinity of S-11 and S-12 and the following intervals be utilized for sample collection (regardless of the depth to water): 0'-2', 3'-3.5', and 10' - 10.5'. XRF screening is also recommended to determine if further vertical delineation is necessary. All soil samples should be analyzed for full TAL analyses. In addition, the following intervals should be screened with use of the XRF: 5.0'-5.5' and 7.0'-7.5'. Intervals

with the highest XRF results or with visual contamination should be collected and analyzed by the laboratory for TAL analysis.

Sherwin-Williams will collect additional samples from the locations noted by USEPA. These locations are identified on revised Figure 8. The sampling protocol will be that proposed in the response to the USEPA Soil Sampling Comment #6.

2. *The extent of soil contamination (arsenic and lead) within the western area of the Rt. 561 Dump site has not been fully delineated. Both the 2005 and the 1994 & 1995 soil results indicate that arsenic and lead contamination are present in a north/south direction along the western boundary of the Rt. 561 Dump site. The 1994 & 1995 results (specifically sample numbers: 57-61 - see Figure 6) indicate that lead in soil is above screening criteria; whereas for arsenic, (including the sample locations mentioned above) as well as, sample numbers 65 - 70 (see Figure 7), soil concentrations exceed the arsenic screening criteria. In addition, delineation of the arsenic contamination is incomplete.*

As a result, EPA requires that five (new) soil borings be proposed in this area, and that samples be collected at the following depths: 0'-2', 3'-3.5', and 10'- 10.5'. XRF screening is also recommended to determine if either further vertical or horizontal (towards Rt. 561) delineation is necessary. All soil samples should be analyzed for full TAL analyses. In addition, the following intervals should be screened with use of the XRF: 5.0'-5.5' and 7.0'-7.5'. Intervals with the highest XRF results or with visual contamination should be collected and analyzed by the laboratory for TAL analysis.

Sherwin-Williams is proposing to collect samples from five additional locations along the western portion of the site. As shown on revised Figure 8, three of the locations are immediately adjacent to the fence separating the site from Route 561, and two locations are located approximately 50 feet east of the fence.

The borings will be installed and the samples will be collected in accordance with the proposed sampling protocol presented in the response to the USEPA Soil Sampling Comment #6.

3. *Based on previously collected data, there is an apparent "hot-spot" within the vicinity of soil sample numbers: 28, 29, and 51 (see Figures 6 & 7). The only sample collected at depth within this vicinity during the 2005 RI activities was sample number DMSB-0037; however, no sample was collected to the north of 29, nor to the south of 51. Note, at sample number DMSB-0051, there was an exceedance for lead at the 3'-3.5' interval. This exceedance was not accurately depicted in the figures and should be corrected in future submittals. Additional samples should be proposed within the vicinity of these three previously collected samples (including to*

the east and west). In addition, sampling depths should be consistent with those intervals presented above.

Figure 3-9, “Dump Site Contaminant Distribution Map”, in the November 2003 Work Plan presents the numerical results that were summarized graphically on Figures 6 and 7. The data referenced were collected by the USEPA using XRF analyses, with some split samples analyzed for a full suite of parameters pursuant to CLP methods. However, samples collected at the locations referenced in this comment were only screened in the field using XRF.

Based on the data for each of the referenced samples, it does appear as though elevated levels of COPCs that may constitute a localized hot spot may be present at former location 28, where lead was reported at a level of 45,824 mg/kg, and arsenic was reported at 245.72 mg/kg. Elevated levels of other metals were also reported. However, arsenic and lead levels reported for former sampling locations 29 and 51 were substantially lower than those from former location 28, and no other metals were reported at levels above screening criteria.

The data presented on Figure 3-9 in the November 2003 Work Plan also support a conclusion that the elevated concentrations of COPCs reported for former location 28 were bounded during the USEPA sampling. Samples were collected approximately 50 feet east of the referenced samples (locations 26, 27 and 54), and, except for antimony at approximately 18 mg/kg (screening criterion of 14 mg/kg), no metals were reported at concentrations greater than screening criteria. Samples were also obtained south and southeast of location 51, (locations 52 and 55), and arsenic, which was reported at approximately 20 mg/kg, is the only COPC reported at levels above screening criteria.

However, these data were screened with an XRF unit, and there is no evidence that anything other than surface soil samples were collected in these locations. Therefore, Sherwin-Williams is proposing additional sampling in the area to address three objectives:

- i. Determine whether the XRF results reported for former location 28, where the highest lead and arsenic levels were reported, are representative of actual conditions.
- ii. Obtain a vertical profile, including vertical delineation, of COPCs at former location 28; and

- iii. Obtain adequate data to demonstrate that the COPCs reported for former location 28 have been horizontally delineated, particularly off-site.

To achieve these objectives, three additional borings will be installed:

- i. One boring will be installed at the location of former sample 29;
- ii. One boring will be installed to the north of former location 29, between the fence and the adjacent residential property; and
- iii. One boring will be installed at former location 51.

Sampling will be conducted as per the proposed protocol presented in response to the USEPA Soil Sampling Comment #6.

These data, combined with the results obtained during the Strategic Sampling and additional sampling that will be performed at the Dump Site and adjacent residences are expected to adequately define the extent of COPCs that maybe present in the area referenced by the USEPA. For example, results obtained during the Strategic Sampling have provided a degree of delineation of former location 28 to the west (DMSB0037), former location 29 to the west (DMSB-0051), and former locations 28 and 51 to the east (DMSB-0040, DMSB-0042, DMSB-0001, DMSB-0002). It is acknowledged that the samples obtained to the east are limited to shallow intervals, and that, based on the results found at former location 28, additional vertical sampling in one or more locations may be merited.

The lead exceedance referenced by the USEPA for sample location DMSB0051 (3.0'-3.5' interval) was not an exceedance. Lead was found at 400 mg/kg, which is the NJDEP Residential Direct Contact Soil Cleanup Criteria (RDCSCC) for unrestricted use, in the sample. Since the analytical result did not exceed the screening criteria, the result is not interpreted as an exceedance. Therefore, although the table identified the sample as containing lead at a concentration greater than the screening criterion, it did not, and the figure is correct as drawn. The table has been corrected to be consistent with the figure.

Proposed sampling within the Wa-Wa parking area and clarification on the use of the XRF

- 5) See General Comment #4 (above) regarding sampling locations depicted on Figure 8.

During the September 6, 2006 meeting, the USEPA clarified that this comment referred to General Comment #5. As discussed in response to that comment, it was not Sherwin-Williams' intent to imply that the entire proposal for additional delineation in the Wawa parking lot was consistent with the approved Work Plan, but rather that the first two sets of sampling locations, those at the fence and those 50 feet into the parking lot, would be installed at the locations identified in the approved Work Plan and the samples obtained from those borings would be collected from the intervals specified in the approved Work Plan.

- 6) *The EPA concurs with the general soil sample boring locations and depths (0'-2', 3'-3.5', and 10' - 10'.5') presented in the May 23, 2006 plan. In addition, the following intervals should be screened with use of the XRF: 5.0'-5.5' and 7.0'-7.5'. Intervals with the highest XRF results or with visual contamination should be collected and analyzed by the laboratory for TAL analysis. Note, it may be more useful to shift the proposed boring location (in close proximity to soil sample number DMSB-0053) either slightly to the east or west depending on site conditions.*

As discussed during the September 6, 2006 meeting, the ability to use the XRF combined with the knowledge that has been gained regarding the distribution of COPCs in subsurface soil has allowed the development of an alternative sampling approach. As discussed below, Sherwin-Williams intends to use the XRF unit to analyze the surface soil sample and the samples from the bottom six inches of each two-foot interval until the XRF results find that no COPCs are present at levels greater than screening criteria. Samples will be collected for laboratory analysis based on the XRF results.

However, additional information is requested by the EPA in order to clarify the use of the XRF screening tool and the approach used to select "step-out" sample intervals. It is understood that the XRF screening tool will be used to collect a soil sample for screening purposes at each of the three intervals during bore-hole sampling operations, and that a "positive" result on the XRF at the 10'-10'.5' interval will require an additional 2 ft. interval to be sampled and screened with the XRF (and that additional 2 ft borings will continue if the results are "positive"). In fact, there may be several intervals which are collected and screened with the XRF until a "clean" sample is encountered and sent to the laboratory for confirmatory analyses. What is unclear; however, is how this data will be used to collect the additional samples at the 25 ft. "step out" locations. For instance, if the XRF results indicate that only the 10'-10.5' interval is above the XRF screening value, would only the 10'-10.5' interval be sampled at the 25 ft. step-out, and if only one sample along the "transect line" had a positive result, would only one boring location to the north be proposed?

EPA is requesting that additional information be provided as to the intended use (and interpretation) of the XRF data and how it will translate to the collection of

samples within the Wa-Wa parking area. Based on the fact that contamination at the Rt. 561 Dump site varies widely from being either shallow or deep (most notably in the north/west corner), it would be more acceptable if there was a uniform/consistent approach outlined.

Sherwin-Williams submitted to the USEPA in a November 29, 2006 letter, a proposed soil and sediment sampling protocol. The protocol was developed in response to the USEPA's request for a sampling protocol incorporating use of XRF and the experience gained from the Strategic Sampling program. This protocol, with the modifications noted in this response to comments, will be that used to perform the investigation in the Wawa parking lot. A brief summary of the proposed sampling protocol is provided below.

Soil and sediment samples will be obtained from the surface (the 0" – 6" interval) and from sequential two-foot intervals (1.5' – 2.0', 3.5' – 4.0', 5.5' – 6.0'. etc.) and screened with the XRF. When the XRF results find the screening criteria are achieved, a confirmatory sample will then be collected from the next deeper two-foot interval. If XRF analysis of the confirmatory sample finds neither lead nor arsenic above screening criteria, the boring will be terminated; if lead or arsenic are found above screening criteria, the boring will be extended until two sequential two-foot intervals with neither lead nor arsenic above screening criteria are obtained.

Up to four samples will be collected for laboratory analysis for TAL metals: (1) the surface (0"- 6" interval); (2) the 1.5' – 2.0' interval; (3) the two-foot interval at which vertical delineation is achieved; and (4) the depth interval at which the XRF screening finds the highest lead and/or arsenic concentrations. Fewer samples will be sent for laboratory analysis if vertical delineation occurs at the surface, the 1.5'-2.9' interval or the 3.5'-4.0' interval. Specific sampling and analysis scenarios and an example figure are provided in the November 29, 2006 letter.

When additional samples are collected for horizontal delineation ("step-out boring"), the same XRF screening approach will be utilized. Regardless of the results of the XRF screening at this step-out, the boring will always be completed to at least the depth at which the immediately adjacent boring was vertically delineated. Again, please refer to the example provided in the November 29, 2006 letter and Figure 1, attached to that letter.

Additional soil sampling under Rt. 561 and on the opposite side of the road

2005 soil sample results at locations DMSB-0029 and DMSB-0043 along with data from previous investigations (sample locations 18 and 19) indicate that there is the possibility that soil contamination extends under the Rt. 561 roadway. EPA may

require additional sampling to the west (under the roadway and possibly on the other side of the road) based on the 2006 XRF results and further review of the 2005 and previous investigation data.

As discussed at the September 6, 2006 meeting, Sherwin-Williams has reviewed historical documents to determine the history of Route 561. Based on the results of the review, we have concluded that Route 561 was constructed in 1937, and there was no disturbance of the roadway corridor prior to construction of the road. The information reviewed included the 1932 aerial photograph referenced by NJDEP at our September 6, 2006 meeting, and as-built drawings of Route 561, dated 1938, located at the Lindenwold Department of Public Works.

The 1932 aerial photograph showed that the area surrounding the Dump Site, including the current location of Route 561, was undeveloped, consisting primarily of wooded wetland. No clearing or other signs of development or disturbance was noted. The only sign of development shown on the 1932 aerial photograph was a residence, presumably the same residence that currently occupies the property, near the southwest corner of Clement Lake, behind where the WaWa currently stands.

The Route 561 as-built drawings confirmed that the area adjacent to the Dump Site was undeveloped in 1937 at the time of roadway construction. Based on the as-built drawings, the area was forested until the roadway right-of-way was cleared and graded. The as-built drawings confirm that the area was a "cut-area" rather than a "fill area". In general, the ground surface was minimally cut, with the cut averaging approximately 1-foot. The final disposal location of the cut material is unknown.

Based on this information, it is concluded that Route 561 predated the use of the Dump Site, and, therefore, it is highly unlikely that waste material originating from the Dump Site is present beneath Route 561.

However, as discussed at the September 6, 2006 meeting, Sherwin-Williams plans to install two borings on the southwest side of Rt. 561, in the vicinity of the newly constructed Medical Arts Building (see revised Figure 8). Sampling protocol specified for the Dump Site will be followed. This data will supplement the data collected as part of the Vacant Lot investigation (sample locations VLSB0028, VLSB0029, VLSB0030). In total, this data will provide a full understanding of the nature and extent of contamination on the southwest side of Rt. 561. As discussed, we will determine at that time whether sampling will be necessary under the roadway.

Surface Water Comments

Sediment/Surface Water text contradict one another, page 4 it is stated that, "These data support the conclusion that the high concentrations of COPCs found in surface water samples obtained from the center of the Site are not currently being transported to White Sands Branch or other down stream locations." However, for sediment samples: "Samples obtained from the most down stream locations, near the point where White Sands Branch flows beneath Rt. 561, contained several metals at concentrations greater than screening criteria."

Sherwin-Williams believes that the two statements are not contradictory. The first addresses the surface water conditions observed during the wet weather and dry weather surface water sampling events, and the second addresses sediment conditions that may be the result of historic discharges.

This issue was discussed in the response to General Comment #4.

NJDEP Comments

The New Jersey Department of Environmental Protection (NJDEP) is in receipt of the above noted document and has completed its review. The following comments indicate the Departments recommendations with regard to the proposals stated within said document.

Understanding Site Conditions:

1. *It is stated on page 5 that COPCs are present at concentrations greater than screening criteria to the west, adjacent to Route 561. It is stated that it is likely that Route 561 predated the disposal activities conducted at the site and, it is unlikely that any constituents extend beneath the roadway. Therefore, Sherwin-Williams does not propose additional delineation along the western property Boundary. NJDEP does not dispute Sherwin-Williams's assertion that Route 561 may predate the disposal activities at this site. However, information in support of this assertion should be provided. Regardless of whether or not the current roadway predates the disposal activities, it is possible that the disposal activities occurred on both sides of the roadway in the wetlands surrounding the White Sand Branch. N.J.A.C. 7:26E-4.1 requires the delineation of the horizontal and vertical limits of contamination to the applicable unrestricted use remediation standard for all media. Therefore, unless adequate justification is provided, NJDEP requests that additional soil and sediment delineation samples be collected to the west of Route 561 to establish a clean zone and to determine if disposal activities occurred on the western side of the roadway.*

As presented in the response to the USEPA comment regarding the potential for COPCs to extend beneath Route 561, Sherwin-Williams performed a review of historical documentation, including a 1932 aerial photograph and the as-built

drawings for the original construction of Route 561. Additional sampling will be conducted at the Vacant Lot on the west side of Route 561 and, based on those results, a decision can be made as to whether sampling beneath the roadway is necessary.

Recommendations for Additional Site Characterization:

2. *Horizontal delineation sampling is proposed at 2 residential properties and the WaWa. Vertical delineation is also proposed at select locations. Sherwin-Williams proposes to use XRF field screening to assist with determining the horizontal extent and final depth of each boring. It is stated on page 6 of the letter that samples will likely be collected from 3 depth intervals: 0'-2', 3'-3.5', and 10'-10.5'. The proposed sampling is acceptable. Note that NJDEP requires that all soil samples must be collected in discrete 6" intervals. Surface soil samples for metals analyses must be collected from the 0-6" interval, unless sufficient rationale is provided for collecting the sample below 0-6".*

All soil samples will be obtained from discrete six-inch intervals. Within the 0' – 2' interval, samples will be collected from 0" – 6" and analyzed for Priority Pollutant Metals (PPM).

Recommendations for Additional Site Characterization/Horizontal Delineation:

3. *It is not clear if additional sediment sampling / delineation has been completed in the White Sand Branch downstream from the site. If this has not already been accomplished as part of another sampling effort, NJDEP requests that sediment contamination be delineated in White Sand Branch and associated wetlands downstream from the site on the western side of Route 561.*

Sherwin-Williams has performed soil and sediment sampling (and surface water sampling) throughout the majority of White Sands Branch as it flows from the Dump Site through the Vacant Lot (across Route 561 from the Dump Site), and through the Burn Site. The results of the White Sands Branch sampling have been presented to the USEPA in the summary reports for each of the Gibbsboro sites. In response to this comment, Sherwin-Williams is preparing figures and tables presenting all of the soil and sediment sampling results along the entire stretch of White Sands Branch. These figures and tables will be provided to the USEPA and NJDEP under separate cover.

Recommendations for Additional Site Characterization/Vertical Delineation:

4. *Four soil boring locations (one in the northwest dump area and three from the central dump area) are proposed to be resampled at depth to accomplish vertical contaminant delineation. This number appears appears disproportionately low. Pursuant to N.J.A.C. 7:26E-4.1, additional vertical delineation samples are required*

in the southwest (e.g., location DMSB0006/0007, where current data indicate lead an order of magnitude above the criterion at 1.5' depth), in location DMSB0033 where arsenic was noted at 835 and lead at 5060 at 1.5', and eastern areas (e.g., DMSB0010, where lead is twice the criterion at 1.5' depth).

As discussed in response to the USEPA's comment regarding additional vertical delineation, Sherwin-Williams will return to the locations identified by the NJDEP for the purpose of collecting additional samples for vertical delineation. The samples will be collected and analyzed according to the protocol presented in the response to the USEPA comment.

5. *In sediments, vertical contamination delineation is also required (e.g., sample location (WSDD0004), as well as offsite horizontal and vertical contaminant delineation further downgradient in the White Sands Branch, beyond where it flows beneath Route 561.*

As discussed in the response to the USEPA comment regarding additional vertical delineation in sediment, Sherwin-Williams proposes to collect additional vertical delineation samples at three sediment sampling locations:

- Culvert – WSDD0025
- WST-12 – WSDD0001
- WST-13 – WSDD0004

The samples will be collected and analyzed as per the protocol presented in the response to the USEPA comment.

Sherwin-Williams has performed sediment sampling throughout the majority of White Sands Branch. The results of the sampling have been presented in the summary reports for the individual sites within which those portions of White Sands Branch are located. In response to this comment, however, Sherwin-Williams is preparing figures and tables presenting all of the soil and sediment sampling results that have been obtained for White Sands Branch. These figures and tables will be presented to the USEPA and NJDEP under separate cover.

Recommendations for Additional Site Characterization/Ground Water - Horizontal Delineation:

6. *Although no groundwater contour map is depicted, the proposed downgradient well location is in the assumed downgradient direction based on topographic relief. However, if it turns out that, after water levels are obtained, this well is not in a hydraulically downgradient direction, additional monitoring wells may be required.*

Sherwin-Williams has agreed to provide the USEPA with a separate document discussing the ground water results for all of the Gibbsboro sites. This document will present both the analytical results and ground water flow directions found at each site. However, Sherwin-Williams has provided the requested information in this submission for the Dump Site.

As discussed in response to the USEPA Ground Water Investigation, the flow direction of shallow ground water is to the southwest, which is consistent with the topographic relief referenced by NJDEP. Ground water contour maps for three events are included as figures in Appendix A. Based on the ground water flow direction, the proposed location of the down gradient well appears to be appropriate.

7. *It is recommended that soil samples be collected from the proposed shallow well boring west of Route 561.*

Soil samples will be collected from the shallow monitoring well that will be installed west of Route 561. The sample collection protocol will be that discussed in response to the USEPA Soil Sampling Comment 6.

Tables:

8. *The citation for the "Action Levels" used in Tables 1 through 4 should be provided. For soil data, the Department assumed the criteria used to be the human-health-based NJDEP Soil Clean-up Criteria (SCCs). It is the Department's position that the fenced-in area represents an ecological exposure area and, therefore ecological risk-based soil screening criteria is also to be used as a basis of comparison on tables and figures.*

Sherwin-Williams presented its proposed Screening Criteria to the USEPA in an January 13, 2005 letter discussing the Strategic Sampling program. In general, two sets of criteria were proposed:

- **Human health, consisting of the most stringent of the NJDEP Residential Direct Contact Soil Cleanup Criteria (RDCSCC) or the USEPA Region 9 Preliminary Remediation Goals (PRGs); and**
- **Ecological protection, focused primarily on freshwater aquatic organisms. These criteria consisted of the most stringent of the NJDEP Sediment Screening Values or published NOAA guidance values.**

As discussed in the January 13, 2005 letter, the screening criteria were intended primarily to assist in the evaluation of COPCs and to guide the extent of delineation. Based on these objectives, therefore, the human health screening criteria have been applied to soil while the ecological screening criteria have been applied to sediment.

Sherwin-Williams acknowledges that in some instances, such as the interior of the fence, ecological criteria for soil may be more applicable than human health criteria. However, as NJDEP is aware, identification of appropriate ecological screening criteria for upland areas is organism-specific. At this time, the relevant ecological receptors have not been identified, and the appropriate ecological soil screening criteria cannot at this time be selected.

However, as part of the RI/FS for the Dump Site and the other Gibbsboro sites, Sherwin-Williams will prepare an ecological risk assessment that identifies the ecologically relevant receptors and evaluates the potential risks associated with the COPCs present at each site.

Figures:

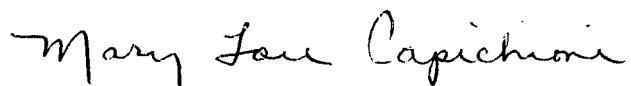

Future figures prepared by Weston should indicate where the soil cap is located, relative to all existing and proposed samples. It is unclear whether the current data set included capped and / or exposed soils.

The soil cap areas have been added to the Dump Site figures and the revised figures have been included in this package. As a note, please be advised that Figures 6 and 7 from the original submission *Evaluation of Strategic Sampling Results, Route 561 Dump Site* dated May 23, 2006, have been replaced by one figure (Figure 6 only) depicting the Dump Site soil and sediment exceedances (arsenic and lead only) analyzed using laboratory methodology only. XRF screening results are not included on this figure.

Also, please be advised that the revised Dump Site figure package does not include a Figure 7. As noted above, Figures 6 and 7 from the original submission have been replaced by revised Figure 6 only. In order to maintain continuity between the original and revised submissions, the proposed sample location map is still being referenced as Figure 8.

Should you have any questions or comments regarding any of the responses and explanations presented herein, please do not hesitate to contact me at 216-566-1794 or via e-mail at mlcapichioni@sherwin.com.

Sincerely,

Mary Lou Capichioni
Director, Remediation Services

Mr. Ray Klimcsak
